

Internet of Things

Manage devices and SIMs easily and transparently

Communications Service Providers (CSPs), as any enterprise, strive to achieve growth and increase earnings potential for their shareholders. In today's competitive communications landscape, Internet of Things (IoT) has emerged as one of the major growth opportunities for the industry.

M2M mobile connections are forecasted to reach 2.1 billion by 2020 according to "Machina Research", a global advisory firm. Total IoT connections will ascend to 3.6 billion with a compounded annual growth rate of 46%.

The M2M segment is far from being a novice industry. Fleet management is one classic example of a traditional M2M application. As connectivity has evolved, other applications have successfully been implemented. Use of M2M spans a wide range of industries such as healthcare monitoring, video surveillance, parking/utility meters, vending machines, intelligent buildings and cars, among others.

Intraway's IoT solution is a centralized, scalable platform used to manage a provider's requirements, from fulfillment to monitoring and fault resolution of M2M devices. Additionally, our solution features intelligent adapters which provide abstraction across multiple devices and data sources that facilitate agile M2M application development.

M2M has already passed through Gartner's® hype cycle and is now ready for implementation. Are you ready to surf this wave?

Unleash the power of your network

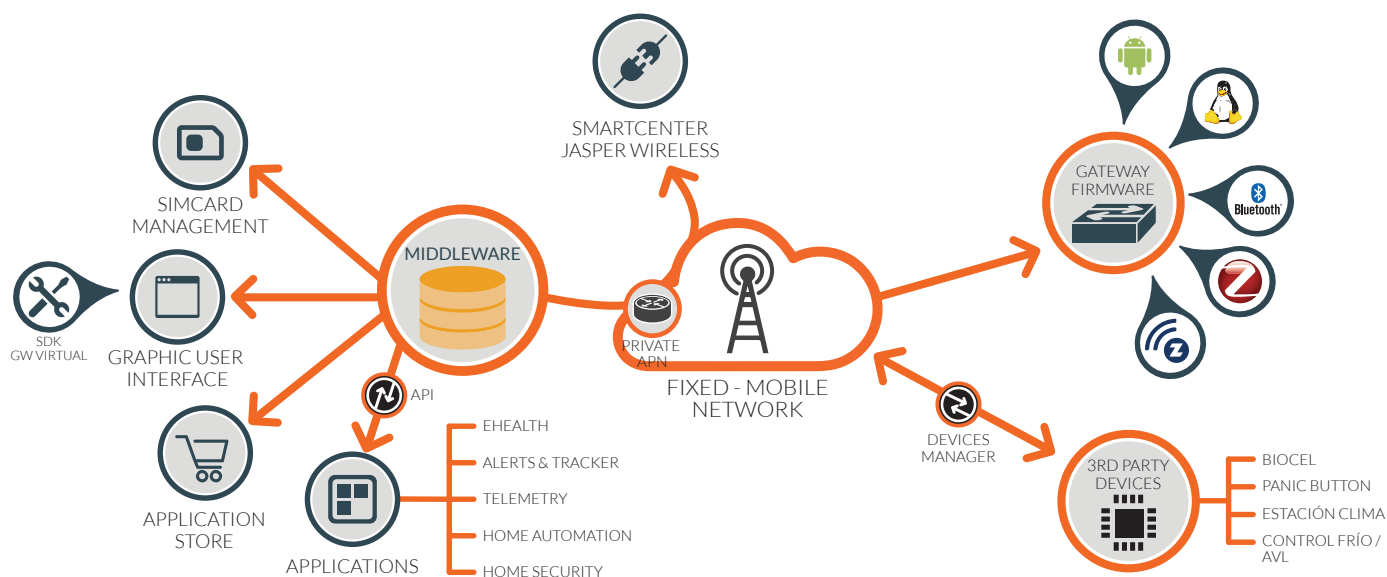

Solution Highlights

- Middleware linking devices / mobile network and applications
- Simplifies operation and connections to applications
- Improves time-to-market
- Global insight of service area coverage
- Flexible reporting and statistics
- Allows forecasting of services being utilized
- Open, flexible and customizable architecture designed to meet Service Provider's business requirements
- CSR "Intelligent" Web Site designed to assist customer support representatives identify, easily understand, and provide effective solutions for customer service issues

Intraway IoT Applications

As part of a joint development project with several partner companies, using its device management platform, Intraway develops and integrates M2M applications, such as:

- Fleet Management: MoveTrack is a GPS device monitoring application which can be used to manage your fleet.
- Asset Tracker: the application provides information in real-time about the status of company assets.
- Home automation: remotely triggers activators located in any physical space with mobile coverage, for both residential and industrial use.
- Healthcare: the application provides doctors with biological parameters from patients. The application gathers vital data such as heart rate, blood glucose level, weight, blood pressure, temperature and blood oxygen saturation.

About Us

The Intraway Corporation is the fastest growing developer of advanced OSS/BSS solutions in the Americas and, since 2013, within Europe. Our solutions currently manage millions of devices deployed in 18 countries. Our 45+ client list includes major market players such as: Mediacom, Telefónica, América Móvil and Tigo. Our module based platform reduces network operating costs and integrates the latest technology in advanced firmware management, service provisioning, fraud / cloning prevention and instant IPv6 enablement. Additionally, we offer a state-of-the-art IPTV platform and sophisticated CRM and Billing systems for small and medium sized operators. Our offices are located in Barcelona, Buenos Aires, London, Mexico City, Miami and São Paulo.
